And now it's real. Can share with your friends. More than 120,000 loops shared with the world!1. Field of the Invention The present invention relates to a liquid crystal display apparatus and a liquid crystal display method. 2. Description of the Related Art As for a liquid crystal display apparatus, a type that displays an image by arranging a plurality of unit pixels provided with one or more subpixels is known. Each subpixel includes a pixel electrode and a counter electrode. The pixel electrode and the counter electrode are disposed between a pair of substrates opposed to each other with a liquid crystal layer interposed between the pair of substrates. A voltage is applied to the liquid crystal layer between the pair of substrates, and the optical transmittance of the liquid crystal layer is changed. The change of the optical transmittance is used as a pixel display (display of a given level of gradation). On the other hand, a liquid crystal display apparatus capable of simultaneously displaying a plurality of pieces of video data by changing the number of dots to be displayed within one screen is known (for example, refer to JP-A-2007-27830 (FIG. 1)). Each piece of video data is constituted of a plurality of frames arranged in the vertical direction and the horizontal direction, and a plurality of segments (pixels) arranged in the vertical direction. A gradation can be displayed by a combination of the pieces of video data. In addition, the number of the pieces of video data to be displayed within one screen can be changed by a user's operation. Further, another liquid crystal display apparatus capable of simultaneously displaying a plurality of pieces of video data by changing the number of dots to be displayed within one screen is also known (for example, refer to JP-A-2006-277981 (FIG. 1)). In the liquid crystal display apparatus of this document, the number of the pieces of video data to be displayed within one screen is controlled by changing the time of driving of a gate-line driving circuit. More specifically, as shown in FIG. 10, as long as a given number of horizontal scan lines are in an on-state, the number of the pieces of video data to be displayed within one screen is fixed, or the number of the pieces of video data to be displayed within one screen is changed in a certain sequence. However, when the number of the horizontal scan lines is equal to or less than a predetermined number, the number of the pieces of video data to be displayed 82157476af
